

# Clean hot surfaces other tools can't touch

Food processing regularly involves frying, roasting, pasteurization, and sterilization—all of which require varying degrees of heat. These hot surfaces call for tools that can withstand high temperatures to clean or handle food products.

# A full high temperature cleaning range

High-temperature tools should comfortably be able to withstand temperatures of 212° F on food contact surfaces and 347°F for 2 minute intervals on other surfaces, which means most conventional tools aren't suited for the job. That's why Remco and Vikan have recently launched a full high-temperature range of sanitation and material handling tools.

This collection is a good solution for sensitive surfaces, where other tools might damage or scratch equipment. Several of these tools come in multiple colors, making them a great fit for a color-coded sanitation plan.

# Features of the high temp cleaning range

## Thoughtful Design

The high temperature scrapers can be used on grills, fryers, and other high-temperature equipment without melting or warping when used properly. These tough tools are made of nylon, so they can be used on stainless steel surfaces without scratching equipment.

## Heat Resistant Bristles

The heat resistant bristles on the high temp brushes are designed to efficiently remove debris from hot surfaces like grills, frying pans, and heat sealers where traditional brushes cannot. These bristles are gentler on sensitive surfaces than wire brushes, but more heat resistant than typical plastic or hair-bristled brushes.

## Handle Options for Nearly Any Need

All of the threaded high temperature tools can be paired with any Vikan or Remco handle. Choose from stainless steel, aluminum, or polypropylene handles to best suit your needs. These handles come in a variety of lengths to ensure that efficient hygienic cleaning is never out of reach.
